A2A Analyse Bot

Setup guide: your own Amazon UK deal-checker in Discord

A Discord bot that scores Amazon UK products for Amazon-to-Amazon and online arbitrage buys. Type **/analyse** with an ASIN and a buy price and you get a colour-coded card back: profit, ROI, a score out of 5, max buy price, suggested quantity, warnings and a 90-day Keepa graph.

It runs on **your own** free Cloudflare account with **your own** keys, so it's fully yours. Download it here: https://github.com/aydeng1298/a2a-analyse-bot

How long it takes
Work through the steps in order and allow about 20–30 minutes. You don't need to know how to code: you'll copy a few keys and run one command.

Getting help
This is a free tool with **no personal support**. If you get stuck, use the **AI helper prompt** on the last page: paste it into Claude, ChatGPT, Gemini or any AI assistant and it'll walk you through every step and explain any error.

What you need

	Cost	Notes
Node.js	Free	A small program the setup needs. Step 1.
Cloudflare account	Free	Runs the bot 24/7. The free plan is enough.
Discord account + your server	Free	Where you use the bot.
Keepa API plan	**From about €49/month**	Required: sales, price history and the graph. A normal Keepa Pro subscription only gives 1 API token a minute, which is fine for testing but too slow for real use.
Amazon SP-API (optional)	Free	Needs a Professional seller account. Step 4 explains why it's worth it.

Step 1: Install Node.js

1. Go to **nodejs.org** and download the **LTS** version.
2. Open the download and click through the installer with the default options.
3. To check it worked, open a terminal (Mac: **Terminal** app; Windows: **Terminal** or **PowerShell** from the Start menu), type `node -v` and press Enter. You should see a version number like `v22.11.0`.

Step 2: Create your Discord bot

1. Go to **discord.com/developers/applications** and sign in.

2. Click **New Application**, give it a name (e.g. *Deal Checker*) and click **Create**.
3. On **General Information**, keep the page open: you'll copy the **Application ID** and **Public Key** in Step 5.
4. Click **Bot** in the left menu, then **Reset Token**, and copy the token somewhere safe. You don't need any of the Privileged Gateway Intents.

> Treat the bot token like a password. Never post it in Discord or share it.

Step 3: Get your Keepa API key

1. Go to **keepa.com**, sign in, and open the **API** page (keepa.com/#!api).
2. Choose a plan (the smallest is fine to start) and subscribe.
3. Copy your **API access key** from the same page.

Step 4: Amazon login (optional, recommended)

The bot works with Keepa alone. Connecting your own Amazon Selling Partner API (SP-API) gives you:

- **Gating check for your account**: tells you if *you* need approval to sell a product, with a link to request it. Without it the card says *Gating not checked*.
- **Amazon's own fee figures** at the exact price. Keepa-only fees are estimates and can be out of date.
- **Live Buy Box and FBA seller count**, so the suggested quantity is more accurate.

You need a **Professional** seller account and must be the **primary user**. Amazon reviews your application first, which can take a few days, so you can do Steps 1–3 and 5–6 now and add Amazon later.

1. In Seller Central go to **Apps and Services > Develop Apps** and fill in the developer profile. Choose **Private developer: I build application(s) that integrate my own company**, and tick the **Product Listing** and **Pricing** roles.
2. Once approved, click **Add new app client**. Choose API type **SP API** and the same roles.
3. Open the app's **LWA credentials** and copy the **client ID** and **client secret**.
4. Click **Authorize app** (the arrow next to your app) and copy the **refresh token** (it starts `Atzr|`).
5. Your **Seller ID** is in **Settings > Account Info > Your Merchant Token**.

Step 5: Download the bot and run the setup

1. Open the GitHub page, click the green **Code** button, then **Download ZIP**. Unzip it somewhere easy, like your Desktop.
2. Open a terminal **in that folder**:
   • **Mac**: open **Terminal**, type `cd` and a space, drag the folder into the window, and press Enter.
   • **Windows**: open the folder, right-click an empty space and choose **Open in Terminal**.
3. Type this and press Enter:

```
npm run setup
```

The setup will:

- open a browser for you to sign in to Cloudflare (create a free account if you need one) and click **Allow**,
- create the storage the bot needs and put the bot online,
- ask for your keys one by one: paste each one and press Enter. If you're skipping Amazon for now, answer **n** to that question,
- set up the commands in Discord, and print an **invite link** and an address ending in `/interactions`.

Your keys are saved as encrypted secrets in your Cloudflare account. They're never stored in the folder or on GitHub.

Step 6: Connect Discord to the bot

1. Go back to your app's **General Information** page on the Discord developer site.
2. Paste the address that ends in `/interactions` into **Interactions Endpoint URL** and click **Save Changes**. If it saves, it's working.
3. Open the **invite link** from the setup and add the bot to your server.

That's it
Type **/analyse** in your server, add an ASIN and a buy price, and you're done.

Using the bot

Command	What it does
`/analyse asin:B0... buy:12.99`	Scores one product. Leave out the buy price to see the most you can pay, then tap **Enter buy price**. **Try another price** re-scores it at a different price.
`/analyse_bulk`	Paste a list (`B0... 12.99, B0... 8.50`) or attach a CSV with the ASIN then the buy price on each row. Results post in the same channel when done (about 4 a minute): a ranked summary, full cards for the best buys and a CSV of everything.
`/analyse_settings`	Set your own prep fee, VAT status, profit targets and ROI rules. See below.
`/analyse_rules`	Shows the rules your deals are scored with.

Reading the card

Line	Meaning
Score	**5 Strong buy** (purple) · **4 Buy** (green) · **3 Maybe** (yellow) · **1 Skip** (red) · **0 Loss** (grey)
Profit line	Your buy price, profit per unit after all costs, and ROI
Buy Box line	Current Buy Box, 90-day average and estimated sales per month

Line	Meaning
Sellers line	FBA sellers and total offers (and a month ago), and whether Amazon is on the listing and how often it holds the Buy Box
Target line	**Max buy** for your rules, suggested **Qty** (about a month's sales split between the sellers) and **Min price**, the lowest sale price that still makes your minimum ROI and profit, handy for your repricer
Warnings	Price spike, sellers piling in, price fell this time last year, variation listing, hazmat, one seller owning the Buy Box (brand/IP risk), gated

Setting your own rules

Everyone pays different prep fees and sources differently. Use **/analyse_settings** in Discord: no files, no terminal. Your settings only affect *your* lookups, so each person in a server can have their own.

```
/analyse_settings prep_fee:0.45 vat_registered:True
/analyse_settings min_profit:1.50 target_profit:2.50
/analyse_settings roi_ladder:10:80, 15:30, 20:20, 50:17, 100:15
/analyse_settings reset:True
```

Setting	What it means
prep_fee	Your prep cost per unit in £
vat_registered	True if you're VAT-registered (output VAT comes off the sale, VAT on your buy and fees is reclaimed)
min_profit / target_profit	Below the minimum is a Skip; meeting ROI *and* the target is a Buy
roi_ladder	Required ROI % by sales per month, as `sales:ROI`. Anything selling less than the first number is a Skip
unknown_sales_roi	ROI % needed when sales are unknown
min_price_roi	ROI % used for the Min price figure
inbound_per_kg / storage_per_cuft	Shipping to Amazon per kg, and FBA storage per cubic foot per month, in £
reset	Back to the server defaults

Percentages can be typed as `20` or `0.20`. Run **/analyse_settings** with nothing after it to see your current settings.

Sharing it in a community server

Everyone who uses your bot spends **your** Keepa tokens, and the gating check is for **your** Amazon account. Before opening it up, set these in the `wrangler.toml` file in the bot's folder (open it with any text editor), then run `npm run deploy`:

Setting	What it does
DAILY_LIMIT	Lookups per person per day (0 = unlimited). A bulk list counts one per ASIN

Setting	What it does
ALLOWED_ROLE_IDS	Only people with one of these roles can use it
ALLOWED_CHANNEL_IDS	Only works in these channels
ADMIN_USER_IDS	These people skip the limits

To copy an ID: in Discord turn on **Settings > Advanced > Developer Mode**, then right-click a role, channel or person and choose **Copy ID**.

If something goes wrong

Problem	Fix
Discord won't save the Interactions Endpoint URL	The Application ID or Public Key was pasted wrong. Run `npm run setup` again and re-enter them (leave the others blank).
"The application did not respond"	In the bot's folder run `npm run logs`, try the command again in Discord, and read the error that appears.
"Keepa is out of tokens"	Wait a few minutes. If it keeps happening, set a DAILY_LIMIT or get a bigger Keepa plan.
"Amazon sign-in failed"	Re-copy your SP-API refresh token: run `npm run setup` and answer **y** to the Amazon question.
Want to change a key	Run `npm run setup` again. Leave any answer blank to keep the old value.
New version released	Back up your `wrangler.toml`, download the new ZIP, put your `wrangler.toml` back and run `npm run setup`.

Stuck? Let an AI walk you through it

Open Claude, ChatGPT, Gemini or any AI assistant. Copy everything in the grey box, fill in the two **[brackets]** and send it. Then follow its steps one at a time, and paste it any error you get.

```
I'm setting up "A2A Analyse Bot", a free open-source Discord bot that checks Amazon UK
products for resellers. It runs on my own Cloudflare account with my own Keepa key (and
optionally my own Amazon SP-API keys).

The full instructions are here: https://github.com/aydeng1298/a2a-analyse-bot
Please read the README on that page (and docs/A2A-Analyse-Bot-Setup-Guide.pdf if you can
open it) before you start. If you can't open links, tell me and I'll paste the README text
to you.

My computer: [Mac or Windows]
Do I want to connect my Amazon seller account (SP-API) now: [yes / no / not sure]

How I'd like you to help:
- I'm not technical. Take me through ONE step at a time, in plain English.
- Tell me exactly what to click, where, and what to type. Put anything I need to type or
paste in a box so I can copy it.
- After each step, wait for me to say "done" or paste what I see before you give me the
next step.
- If I paste an error message, explain what it means in plain English and tell me the fix.
- The setup is: install Node.js, create a Discord application and bot, get a Keepa API key,
(optionally) create a private Amazon SP-API app, download the project ZIP from GitHub, run
"npm run setup" in a terminal inside the project folder, paste the /interactions address
into the Discord app's "Interactions Endpoint URL", then invite the bot to my server.
- IMPORTANT: never ask me to paste my bot token, Keepa key, Amazon keys or any password
into this chat. The setup command asks for them privately in the terminal; I'll paste them
there.
- Don't suggest changing the bot's code. If something in the instructions seems wrong,
tell me and suggest the simplest workaround.

Start with step 1.
```

Keep your keys private

Never paste your bot token, Keepa key, Amazon keys or passwords into an AI chat, a Discord message or anywhere public. Only paste them into the terminal when the setup asks for them.

The same prompt is on GitHub in `docs/AI-SETUP-HELPER.md`, which is easier to copy from on a computer.
